

As time has shown, the coating that is/was on Aluminum siding is not indestructible. It does erode, chalk and fade. And in extreme cases, the metal itself can be exposed, and then oxidize. If your home is suffering from this fate, Diamond Vogel® has the solution. By adding a fresh coat of top quality latex paint, you can add years of brilliance to your home.

Surface Preparation

As with most exterior painting projects, proper surface preparation is the key to restoring your aluminum siding. Begin by thoroughly cleaning your siding of all loose dirt, chalk and other contaminants. Cleaning of the surface can be done by hand washing with warm, soapy water or with the use of a high pressure washer (2500 psi minimum). Pay close attention to the chalk that may be on the surface. Chances are that the original coating on the siding had chalked quite badly. Test for chalk by rubbing your hand on the siding, checking for a transfer of chalk onto your hand. Chalk must be completely removed prior to painting. The use of a household detergent or a pre-paint cleaner will aid in the cleaning process. Be sure to rinse the surface thoroughly, not allowing detergent to dry on the surface, after using any cleaning agents.

Coating Selection

Clean & Sound Paint: If after the preparation process, the bare aluminum is not showing, the application of 2 coats of a 100% Acrylic paint such as Diamond Vogel® Exterior Permacyl®, Weather-Plate® or All Season products would be recommended.

Bare Aluminum: If after the preparation process, there is a presence of the bare Aluminum, a coat of Diamond Vogel® V-Cote 200 100% Acrylic Maintenance Primer would be recommended. A finish of 2 coats of a 100% Acrylic paint such as Exterior Permacyl®, Weather-Plate® or All Season® would then be recommended. Coating may be applied by brush, roller or spray with spraying giving you the smoothest factory like finish. The use of a flat finish will help reduce the magnification of any surface imperfections such as dents.
